

Ensemble of CNN Architectures for COVID-19 Detection from CT Scans

(2021)

Problem

Detecting COVID-19 from chest CT scans during the early pandemic period.

Method

An ensemble combining ResNet, DenseNet, and EfficientNet backbones.

Dataset

COVID-CT public dataset.

Evaluation

Accuracy, F1-score, and AUC.

Results

The ensemble reached 0.96 AUC on the original test set.

Limitations

The dataset was collected early in the pandemic and may not reflect later viral variants or updated scanner protocols.
